Virtual Seminar

How Reconstructive Urology Helps Restore Urinary Health

Reconstructive urology focuses on restoring normal urinary function for individuals affected by injury, disease, prior surgery, congenital conditions or cancer treatments. This area of care is focused on the treatment of conditions such as urethral strictures, urethral trauma and other forms of urinary dysfunction or injury, with treatment grounded in a multidisciplinary approach that includes comprehensive evaluation, shared decision-making, minimally invasive surgical options and long-term follow-up.

Join us for a virtual discussion, during Urology Awareness Month, where Dr. Anh T. Nguyen will explain what reconstructive urology is, provide an overview of the conditions commonly treated and share the latest surgical and minimally invasive techniques and innovations that are advancing patient care.

Presenter:

Anh T. Nguyen, M.D.
Assistant Professor of Urology
Weill Cornell Medicine

This seminar is FREE and open to the public.
Registration is required for Zoom information.
